THRIVE products are an environmentally safe, all natural solution to healthier, more productive plants

THRIVE products are a liquid blend of **Plant Growth Promoting Bacteria** with minerals and micro-nutrients specially formulated for each application. They create a healthy, productive environment that is essential for superior plant growth and vitality. The complex micro-organisms in THRIVE make it **much more effective** than products containing just *microrhizae* (fungi). THRIVE works from the roots up. The microbial activity introduced into the soil stimulates root growth, mass and length. THRIVE can be used with all types of fertilizers. In addition to enhancing the bioavailability of fertilizer and decaying organic matter, the bacteria in THRIVE colonize on the hair like structures of the plant root to increase nutrient absorption and stimulate growth. The result is more resilient and robust plants that are better able to withstand transplant stress, excessive heat and disease. Increased flowering and fruit bearing is also common. Thrive can be mixed with water or applied directly to the soil.

Thrive contains no fertilizer, herbicide or pesticide. It is environmentally friendly, safe to use around children and pets and will not interfere with other treatments. The bacteria in THRIVE will remain viable between 35 and 120 degrees and with as little as 18% soil moisture.

Aqua-One for Ponds:

- Consumes Excess Nutrients and is Excellent for Populating Bio-filters
- Improves Clarity by Reducing Suspended and Dissolved Solids
- Is Safe for all Fish and other Aquatic Vertebrates and Crustaceans
- Reduces Organic Sludge Build-up
- Reduces Ammonia and H₂S and Their Associated Odors
- Can be Used in Both

Aqua-One is likely the strongest and most complex product on the market. It removes ammonia, nitrites, nitrates and sludge, even in cold water. Every bottle has a 'use by' date that is 12 months from when we made it. It has no odor and it costs less than most other brands.

Turf THRIVE is a revolutionary development in live microbial treatment for turf. Turf THRIVE contains all the living organisms needed to produce thick, lush turf in lawns, golf courses and commercial properties.

Thatch Remover is a complex blend of safe, natural, beneficial microbes that break down thatch. By accelerating the natural decomposition, Thatch Remover turns a common problem into rich, organic fertilizer. It is easier to use than dry products that have to be applied with a broadcast spreader. One quart will treat 5,000 square feet and only take about four minutes to apply. It is environmentally friendly, safe to use around children and pets and will not interfere with other lawn treatments.

Compost THRIVE is a concentrated, living microbial treatment that accelerates composting and produces higher quality organic fertilizer. Compost Thrive works with lawn & garden, kitchen and animal compost.

Clean Pet THRIVE is a blend of beneficial bacteria that consume the nutrients in solid and liquid waste, which cause odor. There are a lot of other products on the market that claim to eliminate odors from animal waste, but most of them are either dry products or chemical enzymes. These types of products simply can't compare for the following reasons:

1. Dry microbial products aren't complex
2. Chemicals typically just cover up the odor rather than removing the waste.
3. Enzyme products only do part of the job of breaking down and consuming waste whereas C.P.T. is made up of live bacteria that use the waste as a food source.
